Resistors in Parallel

\[ R_{eq} \]
What happens at a junction?

Initial current $I_{tot}$ splits up:
$I_1$ through $R_1$ and $I_2$ through $R_2$

**Charge is conserved:** $I_{tot} = I_1 + I_2$

More charge will be able to travel through the path of least resistance

If $R_1 > R_2$, then $I_2 > I_1$
Resistors in Parallel

Note: $\Delta V$ across each resistor is the same

\[ I = I_1 + I_2 = \frac{\Delta V}{R_1} + \frac{\Delta V}{R_2} = \Delta V\left(\frac{1}{R_1} + \frac{1}{R_2}\right) \]

\[ \Delta V = I \left(\frac{1}{R_1} + \frac{1}{R_2}\right) \]

\[ \Delta V = I \cdot R_{\text{eq}} \]

\[ R_{\text{eq}} = \frac{1}{\left(\frac{1}{R_1} + \frac{1}{R_2}\right)} \]

\[ \frac{1}{R_{\text{eq}}} = \frac{1}{R_1} + \frac{1}{R_2} + \ldots + \frac{1}{R_N} \]

For N resistors in parallel:
Understanding the parallel law

\[ R = \rho \frac{L}{A} \]

- \( R \) is prop.to \( 1/A \)
- \( A_{\text{tot}} = A_1 + A_2 \)
- \( A_{\text{tot}} \) prop.to \( 1/R_1 + 1/R_2 \)
- \( R_{\text{tot}} \) prop.to \( 1/A_{\text{tot}} \)
- \( 1/R_{\text{tot}} \) prop.to \( 1/R_1 + 1/R_2 \)
Example:

Find the current in each resistor.
\[ I_1 = \frac{\Delta V}{R_1} = \frac{18V}{3\Omega} = 6A \]
\[ I_2 = \frac{\Delta V}{R_2} = \frac{18V}{6\Omega} = 3A \]
\[ I_3 = \frac{\Delta V}{R_3} = \frac{18V}{9\Omega} = 2A \]
(Total I = 11A)

Find the power dissipated in each resistor:
\[ P_1 = I_1\Delta V = 6A \times 18V = 108 \text{ W} \]
\[ P_2 = I_2\Delta V = 3A \times 18V = 54 \text{ W} \]
\[ P_y = I_3\Delta V = 2A \times 18V = 36 \text{ W} \]
Total P = 198 W
Example:

Find $R_{eq}$:

$$\frac{1}{R_{eq}} = \frac{1}{R_1} + \frac{1}{R_2} + \frac{1}{R_3} = \frac{1}{(3\,\Omega)} + \frac{1}{(6\,\Omega)} + \frac{1}{(9\,\Omega)} = \frac{11}{(18\,\Omega)}$$

$$R_{eq} = \frac{18}{11}\,\Omega = 1.64\,\Omega$$

Find the power dissipated in the equivalent resistor:

$$P = \frac{(\Delta V)^2}{R_{eq}} = \frac{(18\,V)^2}{1.64\,\Omega} = 198\,W$$

Also, $P = I\Delta V = 11\,A \times 18\,V = 198\,W$
Comparing resistors and capacitors

Resistors in series are like capacitors in parallel. Resistors in parallel are like capacitors in series.

\[ R \propto L \text{ and } C \propto \frac{1}{L} \]

\[ R \propto \frac{1}{A} \text{ and } C \propto A \]
Quiz 18.1

Use a piece of conducting wire to connect points b & c, bypassing $R_2$.

What happens to the brightness of Bulb 2?
It goes out.

What happens to the brightness of Bulb 1?

$$\Delta V = I_{\text{orig}}(R_1+R_2)$$

$$\Delta V = I_{\text{new}}(R_1)$$

$I_{\text{new}} > I_{\text{orig}}$

Brightness of Bulb 1 increases due to increased power due to increased current.
Quiz 18.2:
Current $I_{\text{orig}}$ is measured in the ammeter with the switch closed. When the switch is opened, what happens to the reading on the ammeter?

Initially, all current flows through switch, bypassing $R_2$. 
$$\Delta V = I_{\text{orig}} R_1$$

When switch is opened, all current is forced through $R_2$; we have a circuit with two resistors in series.
$$\Delta V = I_{\text{new}} (R_1 + R_2) = I_{\text{new}} (R_{eq})$$

$R_{eq} > R_1$ and $\Delta V$ remains fixed, so $I_{\text{new}} < I_{\text{orig}}$. (current decreases)
What happens when you have resistors in series AND in parallel?

Find $R_{eq}$ through multiple steps:
1. Connect in series
2. Then connect in parallel
3. Repeat #1-2 as needed
Kirchhoff’s Rules for Complex DC circuits

Used in analyzing relatively more complex DC circuits

1. Junction rule
2. Loop rule
Junction Rule

Sum of currents entering any junction must equal the sum of the currents leaving that junction:

\[ I_1 = I_2 + I_3 \]

A consequence of conservation of charge (charge can’t disappear/appear at a point)
Loop Rule

“The sum of voltage differences in going around a closed current loop is equal to zero”

Stems from conservation of energy

\[ +\varepsilon - IR_1 - IR_2 = 0 \]

\[ \varepsilon = IR_1 + IR_2 \]
Application of Loop Rule

Choose a current direction (a to b)

When crossing a resistor:  \( \Delta V = -IR \) in traversal direction
When crossing a resistor:  \( \Delta V = +IR \) in opposing direction

When crossing a battery:  - to + terminals:  \( \Delta V = +\mathcal{E} \)
When crossing a battery:  + to - terminals:  \( \Delta V = -\mathcal{E} \)
Example of loop/junction rules
Example of loop/junction rules

Loop rule:
Start at point A, go in CW direction:

\[-I_1R_1 + I_2R_2 = 0\]

\[I_1R_1 = I_2R_2\]

\[I_1/I_2 = R_2/R_1\]
Example of loop/junction rules

Suppose $I_{\text{tot}} = 1.0$ A, $R_1 = 3$ $\Omega$ and $R_2 = 6\Omega$.

Find $I_1$ & $I_2$.

\[ \frac{I_1}{I_2} = \frac{R_2}{R_1} = 2 \]

or, $I_1 = 2I_2$

But $I_1 + I_2 = I_{\text{tot}} = 1.0$ A.

\[ 2I_2 + I_2 = 1.0 \text{ A} \]

So $I_2 = 0.33$ A, and $I_1 = 0.67$ A.
Example of loop/junction rules

Now, calculate $\varepsilon$ of the battery.

\[
\frac{1}{R_{eq}} = \frac{1}{(3\Omega)} + \frac{1}{(6\Omega)} = \frac{1}{(2\Omega)}
\]

$R_{eq} = 2\Omega$

Loop rule for simplified circuit:

$\varepsilon = I_{tot} \cdot R_{eq} = 1.0 \text{ A} \times 2\Omega = 2.0 \text{ V}$
Example of loop/junction rules

Confirm that the amount of the voltage drop across each resistor is 2V:

\[ \Delta V_1 = I_1R_1 = (0.67 \text{A})(3 \Omega) = 2 \text{V} \]
\[ \Delta V_2 = I_2R_2 = (0.33 \text{A})(6 \Omega) = 2 \text{V}. \]
more loop rule

which way will current flow?

\[ \varepsilon_2 \]

\[ R_3 \]

\[ R_4 \]

\[ \varepsilon_1 \]
Starting at point A, and going with the current:

\[ +\varepsilon_1 - IR_3 + \varepsilon_2 - IR_4 = 0 \]

\[ +\varepsilon_1 + \varepsilon_2 - IR_4 - IR_3 = 0 \]

\[ +\varepsilon_1 + \varepsilon_2 = IR_4 + IR_3 \]
more loop rule

But watch the direction of EMF in batteries:

Starting at point A, and going with the current:

\[ +\varepsilon_1 - IR_3 - \varepsilon_2 - IR_4 = 0 \]
\[ +\varepsilon_1 - \varepsilon_2 - IR_4 - IR_3 = 0 \]
\[ +\varepsilon_1 - \varepsilon_2 = IR_4 + IR_3 \]
How to use Kirchhoff’s Rules

• Draw the circuit diagram and assign labels and symbols to all known and unknown quantities
• Assign directions to currents.
• Apply the junction rule to any junction in the circuit
• Apply the loop rule to as many loops as are needed to solve for the unknowns
• Solve the equations simultaneously for the unknown quantities
• Check your answers -- substitute them back into the original equations!
