

PHYS 2D  
PROBLEM SESSION

2012/5/10

# 4.7

- Millikan's oil drop experiment
- Given  $\alpha$ ,  $\rho$ , time/distance of fall  $\Delta t_f/\Delta y_f$ , time/distance of rise  $\Delta t_r/\Delta y_r$ , separation/potential difference of plates  $\Delta x/\Delta V$
- Want to find  $q$  on oil drop
- $q = (mg/E)[(v+v')/v]$
- ◆  $m = 4\pi\alpha^3\rho/3$
- ◆  $E = \Delta V/\Delta x$
- ◆  $v = \Delta y_f/\Delta t_f$
- ◆  $v' = \Delta y_r/\Delta t_r$

# 4.25

□ Frequency of photon from  $n=4$  to  $3$  of hydrogen

◆  $E_\gamma = hf = -13.6\text{eV}(1/4^2 - 1/3^2)$

◆  $h = 4.136 \times 10^{-15} \text{ eV} \cdot \text{s}$

◆  $f = 1.60 \times 10^{14} \text{ Hz}$

□ Frequency of revolution of  $e^-$  in these orbits

◆  $f = 1/T = v/2\pi r$

◆  $K = mv^2/2 = 13.6/n^2 \text{ eV}$ ,  $L = mvr = n\hbar$

◆  $f = K/\pi L = 27.2\text{eV}/n^3\hbar = 6.58 \times 10^{15}/n^3 \text{ Hz}$

◆  $f_3 = 2.44 \times 10^{14} \text{ Hz}$

◆  $f_4 = 1.03 \times 10^{14} \text{ Hz}$

# 5.10

- Compare kinetic energy of electron with  $\lambda=2a_0$  to hydrogen ground state energy
- ◆  $\lambda=2a_0=h/p=h/mv$
- ◆  $K=mv^2/2=(h/2a_0)^2/2m=2.15*10^{-17} \text{ J}=135\text{eV}$
- ◆  $v\ll c$
- ◆ Hydrogen  $E_{n=1}=-13.6\text{eV}$

# 5.18

- Ball with  $m=50\text{g}$ ,  $v=30\text{m/s}$ . Accuracy of  $v=0.1\%$ , find minimum  $\Delta x$
- ◆  $v \ll c$
- ◆  $\Delta p = m\Delta v = 0.05 * 30 * 0.001 = 1.5 * 10^{-3} \text{ J*s/m}$
- ◆  $\Delta p \Delta x \geq \hbar/2$
- ◆  $\Delta x \geq 1.055 * 10^{-34} / (2 * 1.5 * 10^{-3}) = 3.5 * 10^{-32} \text{ m}$

## 5.23

- If  $\hbar=1 \text{ J}\cdot\text{s}$ ,  $m=2 \text{ kg}$ ,  $\Delta x=1 \text{ m}$ ,  $\Delta p=?$ 
  - ◆  $\Delta p\Delta x\geq\hbar/2$
  - ◆  $\Delta v\geq 1/4 \text{ m/s}$
- If  $\Delta v\geq 1/4 \text{ m/s}$  for  $t=5 \text{ s}$ , find  $\Delta x$  afterwards
  - ◆  $x=[x_0, x_0+1]$
  - ◆  $v=[v_0, v_0+\Delta v]$
  - ◆  $x'=vt+x=[v_0t+x_0, (v_0+\Delta v)t+x_0+1]$
  - ◆  $\Delta x'=5\Delta v+1=2.25 \text{ m}$

# 5.28

- Neutron beam with  $v=0.4$  m/s pass through double slit with separation  $d=10^{-3}$  m, detector at  $L=10$  m away. Find  $\lambda$  of neutron,  $y$  of 1<sup>st</sup> zero
- ◆  $\lambda=h/mv=9.92*10^{-7}$  m
- ◆ Destructive interference:  $d\sin\theta=(n+1/2)\lambda$ ,  $\sin\theta\approx y/L$
- ◆  $n=0$ ,  $y=L\lambda/2d=4.96*10^{-4}$  m
- ◆ Can not say which one slit neutron passed through, it's not behaving like a particle

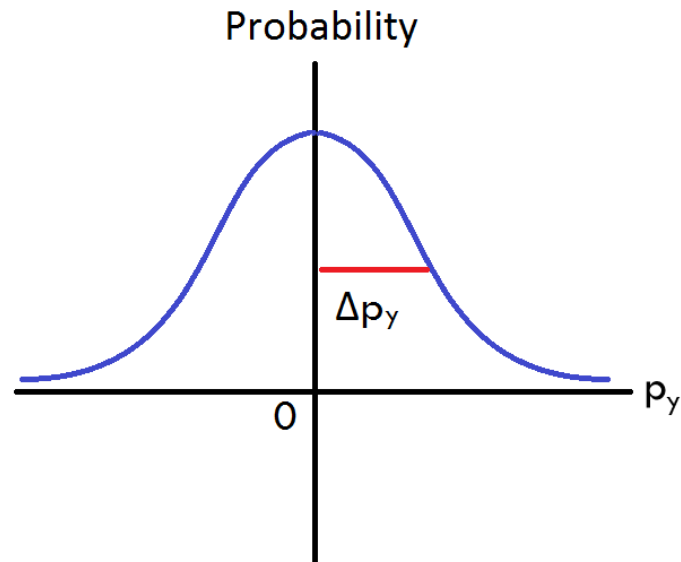

## 5.31

- 1 g particles with  $v_x = 100$  m/s are shot through hole of diameter 2 mm, how far from the hole must you be to see the beam spread by 1 cm
- At the hole, what we know is the uncertainty in  $y$ ,  $\Delta y = 2 \times 10^{-3}$  m
- $\Delta p_y \geq \hbar / 2\Delta y \approx \hbar / \Delta y$ ,  $v_y = 0 + \Delta p_y / m \approx 5.2 \times 10^{-29}$  m/s
- For the particle to move 0.5 cm in the  $y$  direction, it takes  $t \sim 0.005 / \Delta v_y = 9.5 \times 10^{25}$  s
- In this time particle moved  $t \cdot v_x = 1.9 \times 10^{27}$  m

# 5.31

□  $\Delta p_y \Delta y \approx \hbar$

- Measurement of  $p_y$  will most likely give a result between  $\sim -2$  or  $-3\Delta p_y$  to  $+2$   $\sim +3\Delta p_y$
- Rough estimate

# 5.34

- Given a rectangular wave pulse, find its spectral content
- The inverse of example 5.7, where the spectral content is a rectangular pulse

$$g(\omega) = (2\pi)^{-1/2} \int_{-\infty}^{\infty} V(t)(\cos \omega t - i \sin \omega t) dt = 2(2\pi)^{-1/2} \int_0^{\tau} V_0 \cos \omega t dt = \left(\frac{2}{\pi}\right)^{1/2} V_0 \frac{\sin \omega \tau}{\omega}$$

- First zero at  $\omega = \pi/\tau$
- Take that as  $\Delta\omega$
- $\tau\Delta\omega = \Delta t\Delta\omega = \pi$
- $\tau = 0.5\mu\text{s}$ ,  $2\Delta\omega = 2\pi/\tau = 1.26 * 10^7$  Hz
- $\tau = 0.5\text{ns}$ ,  $2\Delta\omega = 1.26 * 10^{10}$  Hz
